Office Action Summary

## DETAIL OF ACTION

1. Applicant's election without traverse of Group I, including claims 1, 3 and 10-20, in Paper No. 22 is acknowledged.

2. Claims 12,13 and 16 are rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention.

As per claim 12, it is unclear as to what it means by the recitation that "separate instruction and data streams are maintained for said array processor". Claim 13 also has a similar problem.

As per claim 16, the phrase "said external environment" lack a proper antecedent basis.

3. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

4. Claims 1,3 and 10-20 are rejected under 35 U.S.C. 103(a) as being unpatentable over Deering et al. (5,745,125).

Deering et al. discloses in figures 2-13 an integrated circuit (112, figures 3 and 4) operating with a memory (106). The integrated circuit have an interfacing circuit and embedded processor (142, figures 5), and an array processor (152). The array processor have a plurality of floating circuits, each including a first MAC unit (514,516) with a first local memory (512, see figure 11), a second MAC (614,616) with a second local memory (612, see figures 13), and a share operand (SRAM 153) as claimed. It is noted that Deering et al. does not specifically discloses the integrated circuit for image frame rendering. However, since Deering et al. disclose the circuit for graphic accelerator, it would have been an obvious field of use to apply the teaching of Deering et al in image frame rendering as claimed. Further, the number of wires in the interface circuit (figure 5) would obviously exceed 256 wires, and the use of simplified IEEE floating point notation in the computation would have been an obvious matter of design choices in choosing the format of data.

5. Applicant's arguments with respect to the claims have been considered but are moot in view of the new ground(s) of rejection.

6. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Chuong D. Ngo whose telephone number is (703) 305-9764. The examiner can normally be reached on Monday-Friday from 7:30 AM to 6:00 PM.
